1 Command-line Options Description

-h , --help

Shows command-line help.

--version

Shows current program version and exits.

-v , --verbose

By default, warnings and errors are sent to standard error. This option switches on process reporting messages to appear on standard error too.

-V <logs_filename> , --logs-filename <logs_filename>

If is possible to open '**<logs_filename>**' then such file will contain all the messages and warnings produced by the program even though they were disabled from standard error with '**quiet**' option.

-q , --quiet

This option disables any message or warning from standard error. It does not disable error report because such errors are pointing a problem which can make **GFF2APLOT** produce unexpected results. Solve the cause of such problems before continuing to run the program in a silent mode.

-P <format_name,page_width,page_height> , --page-bbox <format_name,page_width,page_height> page_bbox=<name,width,height>

This option allows users to define an arbitrary page format, by defining a name for such format and the width and height for that page. See '**page_bbox**' customization variable on page 3 (section 2.1) for further info on this command-line option. It overrides any '**page-size**' command-line option (and any related variable passed through custom files).

-p <format_name> , --page-size <format_name> page_size=<format_name> '<format_name>' is a pre-defined page format from table 2. By default is set to '**a4**'.

--margin-left <length> margin_left=<length> **--margin-right <length> margin_right=<length>** **--margin-top <length> margin_top=<length>** **--margin-bottom <length> margin_bottom=<length>**

You can set page margin with those four variables. '**<length>**' can be given in points, milimeters, centimeters or inches (pt, mm, cm or in, respectively), but is set to points if no units are provided.

-B <color> , --background-color <color> background_color=<color> **-F <color> , --foreground-color <color> foreground_color=<color>**

You can change background —say here page filling— and foreground —say here text, outlines and tickmarks— color for the page. Available colors are defined on table 1, default values are '**white**' and '**black**', for background and foreground respectively.

-T <string> , --title <string> title=<string>

Setting the main title to '**<string>**' for the current figure, by default showing '**align_name**' in the form of '**sequence1_name**' x '**sequence2_name**'.

-t <string> , --subtitle <string> subtitle=<string>

Setting '**<string>**' as the current figure subtitle, by default an empty string.

-X <string> , --x-label <string> x_label=<string>

TO BE DEFINED !!!

-Y <string> , **--y-label** <string>

y_label=<string>

TO BE DEFINED !!!

-C <custom_filename> , **--custom-filename** <custom_filename>

Loading customization parameters from '<custom_filename>'. Now you can load several customization files by passing this option several times. The precedence is the input order in the command-line, so, for the common definitions, the last '<custom_file>' will override previous '<custom_files>' settings. If default customization file ".gff2aplotrc" does exist, it is the first customization that is loaded by the program.

2 Customization Variables Description

2.1 Layout Attributes

page_bbox = <format_name,page_width,page_height> [**undef**]

This variable allows users to define an arbitrary page format, by defining a name for such format and the width and height for that page. Do not include this variable in your custom files if you are using standard page sizes which can be set using '**page_size**', because '**page_bbox**' overrides any further page definition by that variable. If the variable is not set, default value forces the use of any settings given for '**page_size**'. '<format_name>' defines a name for the new page format. '<page_width>' and '<page_height>' are set to points if no unit is given, you can use points, milimeters, centimeters or inches (pt, mm, cm or in, respectively). See table 2 for a reference on already defined page sizes and their dimensions.

page_size = <format_name> [**a4**]

Setting a standard page size, available values for '<format_name>' are listed in table 2. Page width and height values are coded for most common paper formats.

margin_left = <length> [**1cm**]

margin_right = <length> [**1cm**]

margin_top = <length> [**1cm**]

margin_bottom = <length> [**1cm**]

You can set page margin with those four variables. '<length>' can be given in points, milimeters, centimeters or inches (pt, mm, cm or in, respectively), but is set to points if no units are provided.

background_color = <color> [**white**]

foreground_color = <color> [**black**]

These two customization variables accept any '<color>' from those listed on table 1. Default values are '**white**' and '**black**' for '**background_color**' and '**foreground_color**' respectively. These two variables also set the aliases '**BGcolor**' and '**FGcolor**', so that you can use '**bgcolor**' and '**bg**', or '**fgcolor**' and '**fg**', to set any other color-related variable with the same colors you are defining as background/foreground colors.

title = <string> [**undef**]

'**title**' sets the main title to '<string>' for the current figure, by default showing '**align_name**' in the form of '**sequence1_name**' x '**sequence2_name**'.

show_title = <boolean> [**on**]

'**show_title**' switches on/off displaying the figure title. If you do not want to visualize the default title you can set this variable to '**off**', but you are not able to reuse the area of plot where title appears (set '**title_fontsize**' to '**0**' if you want to remove that area from plot).

title_font = [**helvetica-bold**]

TO BE DEFINED !!!

title_fontsize = <length> [**24pt**]

Sets title fontsize, '<length>' can be in pt, mm, cm or in (default is points if no units are given). Setting '**title_fontsize**' to '**0**' forces GFF2APLOT to remove title area from plot, so no space is left for it.

subtitle = <string> [**undef**]

'**subtitle**' sets the current figure subtitle to '<string>', by default it is defined as an empty string.

show_subtitle = <boolean> [on]

'**show_subtitle**' switches on/off displaying the subtitle text. If you do not want to visualize the default subtitle you can set this variable to '**off**', as with '**show_title**' you are not able to reuse the area of plot where subtitle appears (so set '**subtitle_fontsize**' to '**0**' if you want to remove that area from plot too).

subtitle_font = [helvetica]
TO BE DEFINED !!!

subtitle_fontsize = <length> [16pt]

Sets subtitle fontsize, '<length>' can be in pt, mm, cm or in (default is points if no units are given). Setting '**subtitle_fontsize**' to '**0**' forces GFF2APLOT to remove subtitle area from plot, so no space is left for it.

x_label = <string> [undef]
TO BE DEFINED !!!

show_x_label = <boolean> [on]

'**show_x_label**' switches on/off displaying the subtitle text. If you do not want to visualize the default subtitle you can set this variable to '**off**', as with '**show_title**' you are not able to reuse the area of plot where subtitle appears (so set '**subtitle_fontsize**' to '**0**' if you want to remove that area from plot too).

x_label_font = [helvetica-bold]
TO BE DEFINED !!!

x_label_fontsize = <length> [12pt]

Sets X-label fontsize, '<length>' can be in pt, mm, cm or in (default is points if no units are given). Setting '**subtitle_fontsize**' to '**0**' forces GFF2APLOT to remove subtitle area from plot, so no space is left for it.

y_label = <string> [undef]
TO BE DEFINED !!!

show_y_label = <boolean> [on]

'**show_x_label**' switches on/off displaying the subtitle text. If you do not want to visualize the default subtitle you can set this variable to '**off**', as with '**show_title**' you are not able to reuse the area of plot where subtitle appears (so set '**subtitle_fontsize**' to '**0**' if you want to remove that area from plot too).

y_label_font = [helvetica-bold]
TO BE DEFINED !!!

y_label_fontsize = <length> [12pt]

Sets Y-label fontsize, '<length>' can be in pt, mm, cm or in (default is points if no units are given). Setting '**subtitle_fontsize**' to '**0**' forces GFF2APLOT to remove subtitle area from plot, so no space is left for it.

show_percent_box_label = <boolean> [on]
TO BE DEFINED !!!

percent_box_label = <string> [undef]
TO BE DEFINED !!!

percent_box_label_font = [**helvetica-bold**]
TO BE DEFINED !!!

percent_box_label_fontsize = <length> [**9pt**]
TO BE DEFINED !!!

show_percent_box_sublabel = <boolean> [**on**]
TO BE DEFINED !!!

percent_box_sublabel = <string> [**undef**]
TO BE DEFINED !!!

percent_box_label_font = [**helvetica-bold**]
TO BE DEFINED !!!

percent_box_label_fontsize = <length> [**9pt**]
TO BE DEFINED !!!

show_extra_box_label = <boolean> [**on**]
TO BE DEFINED !!!

extra_box_label = <string> [**undef**]
TO BE DEFINED !!!

extra_box_label_font = [**helvetica-bold**]
TO BE DEFINED !!!

extra_box_label_fontsize = <length> [**9pt**]
TO BE DEFINED !!!

show_extra_box_sublabel = <boolean> [**on**]
TO BE DEFINED !!!

extra_box_sublabel = <string> [**undef**]
TO BE DEFINED !!!

extra_box_sublabel_font = [**helvetica-bold**]
TO BE DEFINED !!!

extra_box_sublabel_fontsize = <length> [**9pt**]
TO BE DEFINED !!!
